    <div class="container">
        <h1 class="subtitle">Projects</h1><br>
        <div class="row">
            <div class="about-col-1">
                <h2>Sign language to speech converter</h2><br>
                <p>
                    Speech impaired people throughout the world uses sign
                    language to communicate with other
                    people. However, it is possible only between those peo
                    ple who understands sign language. So
                    our aim is to create a voice for the impaired. Sign la
                    nguage uses hand gestures and other means
                    of non-
                    verbal behaviours to convey their intended meaning. The idea is to create a sy
                    stem
                    which recognizes the bend angle of each finger when an
                    alphabet is signed with the help of a
                    flex sensor and using this information the correspondi
                    ng letter is recognized in the system.
                    After the complete word is signed, it is then transmit
                    ted to an application in our smart phone
                    through a Bluetooth module which is then converted to
                    speech by the app. The modules to be
                    present in the proposed system are Arduino Nano our ma
                    in microcontroller, flex sensors for
                    each fingers to detect the bend angle, a Bluetooth mod
                    ule for transmission, a LCD display.
                </p>
            </div>
        </div>
